Fork Lift Mounted Bucket Lift

POWER-SPRAYS

FORK LIFT MOUNTED BUCKET LIFT

A full GRC mix is heavy. The GRC 125 Combination Mixer efficiently mixes up to 125kgs but this is too heavy to move by hand. Even a mix using a 25kg bag of cement weighs over 60 kgs and exceeds the two man lift limit.

Power-Sprays have recognized this and have developed a range of bucket lifters/movers to suit all applications.

All the mixers use the new Power-Sprays mixing vessel, **reinforced with a removable steel reinforcing ring** for added safety.

Steel bars welded to this ring locate on all versions of the bucket lifter mover.

Once the mix has been produced the full mixing bucket can be moved using a fork lift truck to the area of the factory where the mix is required.

A locking safety arm ensures that the bucket remains stable during moving.

Once at the required location, the bucket is raised by the fork truck. The locking mechanism is disengaged and **the mix is poured either into the spray station or for premix directly into the mould.** The empty mixing bucket is then returned to the mixing station.

Two buckets are supplied so mixing can be continuous.

A wheeled version and a crane mounted version are also available
